## [Video/Music/Photo] How can I synchronize my files?

The applications **ARCHOS Music** and

**ARCHOS Video** automatically detect your files once they are transferred to your device. To do so, you need to launch the application to scan your device. You will see your files displayed in the carousel and can choose to display only those files that have been recently added.

The application **Gallery** works the same way, it automatically scans all your pictures on your device everytime you launch the application. Every type of files is scanned: photos taken with your device's camera, screenshots, images you automatically transferred or received via email and then saved.

All these files can be manually saved by connecting your device to your computer via USB. These files are stored by default on the folders:

Videos : Movies

Musics : Music

Photos : Pictures

Photos/Videos taken by your device : DCIM/Camera

Files received via Bluetooth : Bluetooth

Files saved (e-mail, browser ect...) : Download

Screenshots: Screenshots

All your files can be synchronized with Windows® Media Player (version 11 or later) or iTunes®. the synchronisation only works if your device is connected as a multimedia device.
