

# ARCHOS Connected Self App

## When does the object send the data to the application ?

For your data to be synchronised after your measurement your tablet or smartphone running Android™ or iOS must be switched on and the Bluetooth® connection must be running.

You then just need to open the **ARCHOS Connected Self** application on your device for your data will sync to your smartphone or tablet.

Your connected object has onboard storage for a few measurements, so it can sync a few measurements together. If you don't have your smart device with you for a measurement, don't worry it will sync that measurement next time you have your device on and in range and take a new measurement.
