Troubleshooting

What can I do if I have two similar accessories paired with my system but I can't tell the difference between them ?

If you paired two similar accessories (two Weather Tags for instance) and you want to know which one is which for example to rename or move one of them, simply go

in the **All accessoires** menu and press the desired accessory.

In the contextual menu that is then displayed, select Connection. You will get the opportunity to switch on the LED that will blinks for 5 seconds.
