

User Interface & Device

How do I install and uninstall applications?

There are two different ways to install an application on Android™: either you can do it from an applications store such as Google Play™ or you can install it manually if you have the corresponding apk. file (this is the installer file on android).

Note that some applications require downloading extra data once installation is complete. This is automatically suggested the first time you launch the application.

Installation from Google Play™

Make sure that you are [connected to internet](#) (WiFi preferably) and to have

a [Google™ account](#) associated to your device and then launch the  Google Play™ application. If you do not have a Google™ account, you will be prompted to create one the first time you launch the application.

If you already know the name of the application you want to download, you can search for it by pressing .

If your application has already been installed before (on this device or another), you can access it in Menu > My apps > All. This does not include preinstalled apps on your device, please read the [following FAQ](#) to know the procedure to retrieve preinstalled apps.

Once you found the application that you want to download, press it a first time to get access to its dedicated page. To install it, press either the Install button (free apps or already bought apps) or the button announcing its price (paid application).

For more information about the Google Play™, please read the [following FAQ](#).

You can also ask the [Google Play™](#) website to download an application to your device. To do this you need to be connected to your Google™ account and select your device to confirm the installation. When your device will next connect to

User Interface & Device

internet, it will automatically download the application.

Manual installation

To install an application manually, you must have the corresponding file in .apk format. By default, Android™ prevents manual installation from unknown sources.

For security reasons, you need to allow it by going in  (or ) **Settings** >  **Sécurité** and tick the box Unknown sources.

Once this security is removed, simply copy your file anywhere in your device

memory or SD card. Then, launch the application  **Files** and look for your .apk file. Click on it and select Install. Confirm once it's over.

 Some applications won't install because they might need specific authorisations not provided by your device but also there might be compatibilities issues.

In anycase, Archos can not be held liable for the manual installation of an application from an unknown source. This application may contain viruses that will damage your device or steal your data.

It is strongly recommended to use the Google Play™ to install an application.

Uninstalling an application

There are 3 ways to uninstall an application:

1. From Google Play™: Go in Menu > My apps > Installed and then select your application. Finally, select Uninstall.
2. From  (or ) Settings >  **Apps**. Select the application and press Uninstall.
3. From the  **Menu** : Tap the application you want to uninstall and hold it

User Interface & Device

until the Trash bin  appears and then drag your application into the trash bin.
